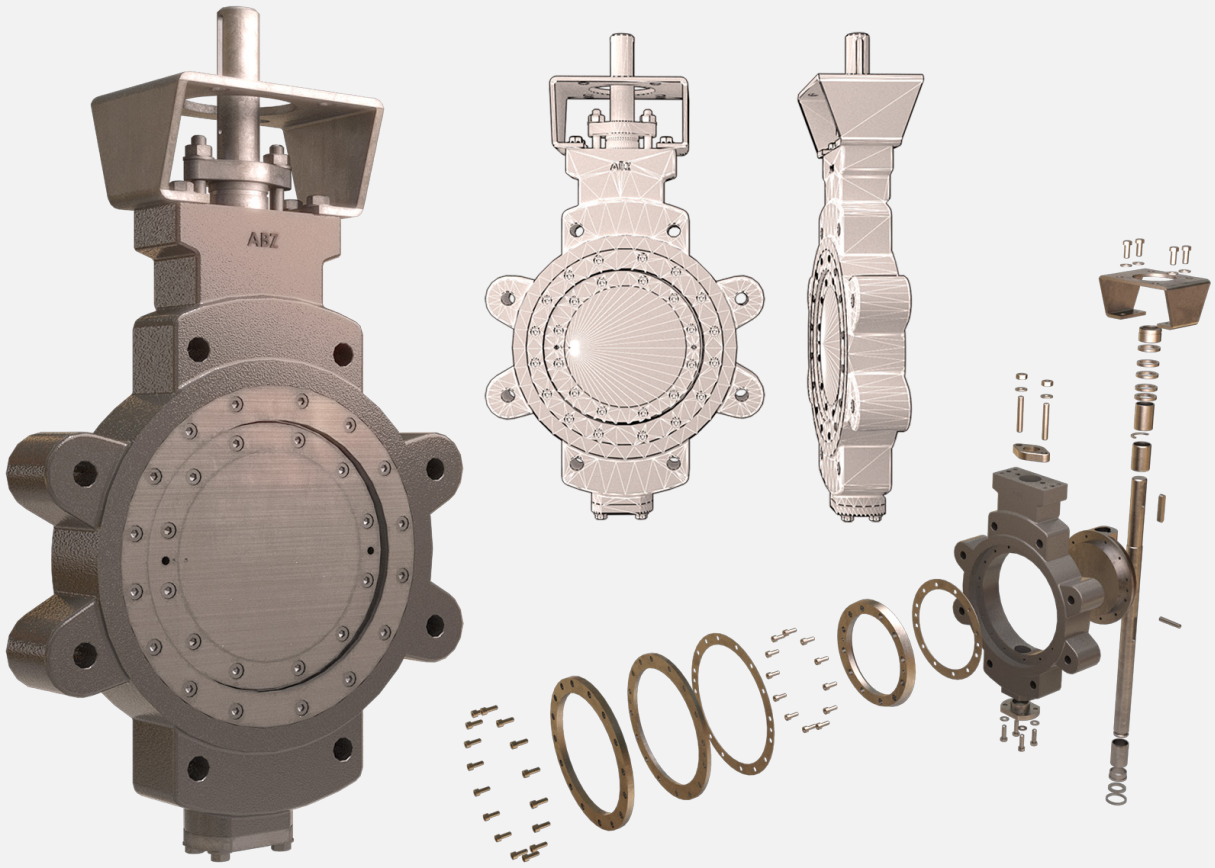
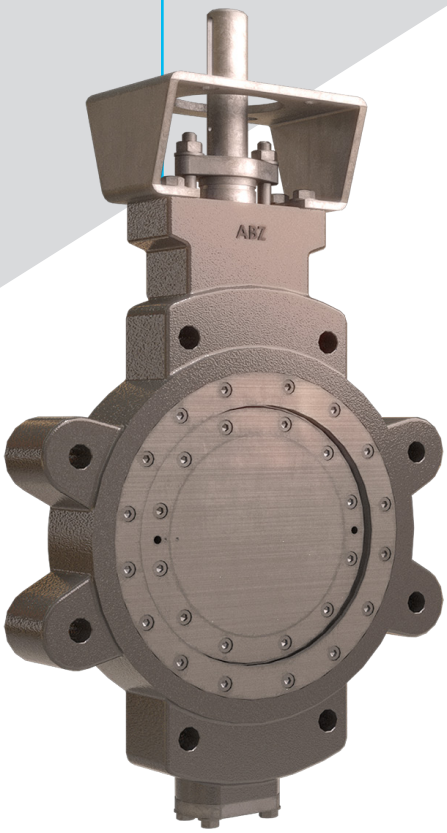
Extreme Series Bidirectional Zero-Leakage Triple Offset Valve Datasheet



ABZ VALVE®
An ASC Engineered Solution

Extreme Series Bidirectional Zero-Leakage Triple Offset Valve

ABZ 6000



Overview

ASC Engineered Solutions' ABZ Extreme 6000 Triple Offset Valve is an ideal solution for positive shut-off or control applications when used in erosive, corrosive and critical applications under ambient, high heat or cryogenic temperatures. The Extreme 6000 is dependable in severe service and comes with maintainable bolt-in seats and seals, which help increase a plant's efficiency as well as reduce the overall cost of ownership.

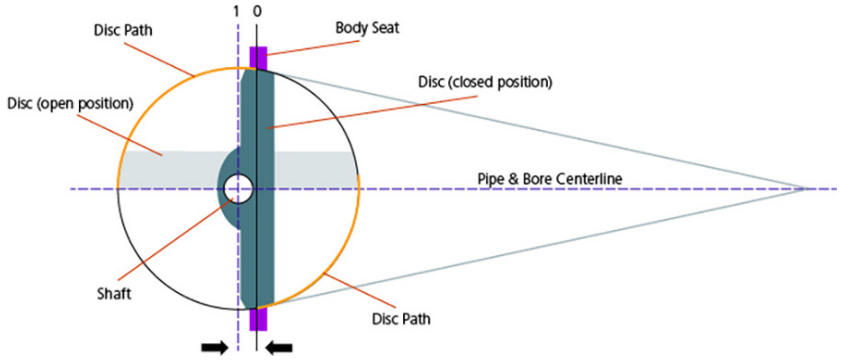
Rather than the concentric bore design of standard valves, the Extreme 6000 sealing geometry is an ellipsis, which provides a friction free design with torque seating. Since the valve's bore and disc are not a perfect circle, the sealing mechanism is allowed to unseat itself with less torque, which results in a lower dynamic torque. Unlike other valves, the ABZ Extreme 6000 Triple Offset is available with multiple end connections and body configurations: lug, wafer, double flange long and short as well as buttweld or custom engineering. The sealing components are inherently fire-safe with metal-to-metal seating while also guaranteeing a bidirectional zero-leakage bubble-tight shutoff.

Principle of Triple Offset Valve Design

1st Offset

The axis of the shaft is placed behind the centerline of the sealing points. The seat and seal are designed conically and on center. Sealing relies on the friction of a soft seat, which can be affected by temperature and pressure.

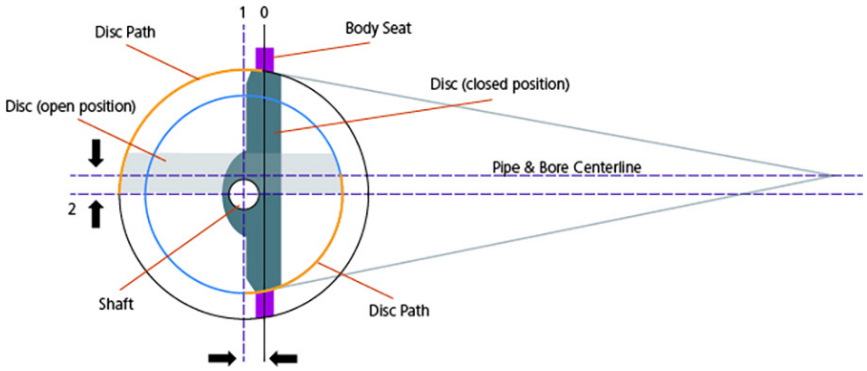
Purpose: To provide positive sealing and increased sealing capacity



2nd Offset

The axis of the shaft is eccentric to the centerline of the sealing points as well as the center of the pipe. The seat and seal remain conically on center and still rely on friction, but it is reduced. Seat materials can still be affected by temperature and pressure, but to a lesser extent.

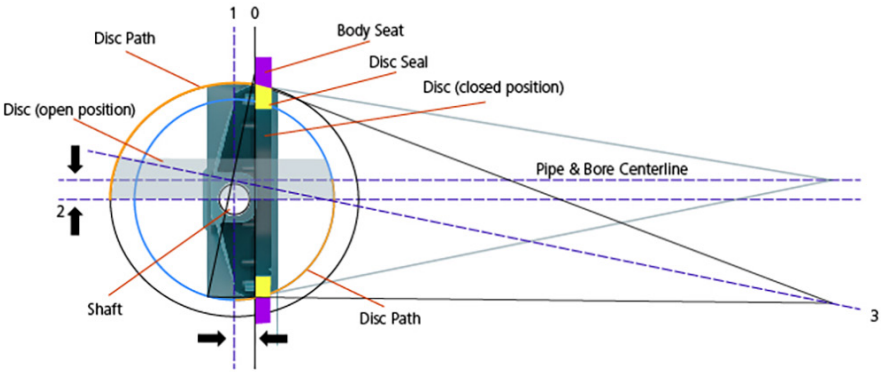
Purpose: To reduce the running torque and the friction between the disc and seat



3rd Offset

The axis of the shaft remains eccentric to the centerline of the sealing points and pipe. The seat and seal cone is rotated away from the center of the pipe, completely eliminating seat and seal friction. The bore, disc, seat and seal are all machined as an ellipse, which helps creates a zero-leakage seal in higher pressure and temperature ranges. Inherently fire-safe.

Purpose: To achieve uniform compression from the disc seal around body seat.

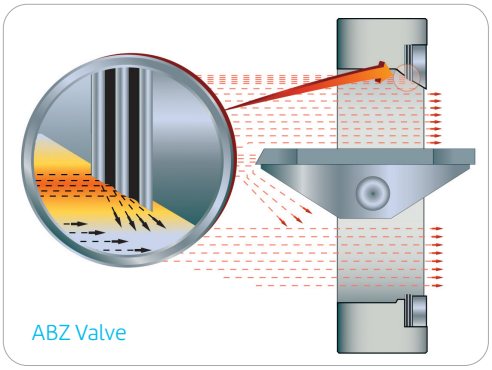


Principle of Sealing

The basic sealing principle of a triple off valve is to utilize a conical seating system.

Many valve designs have a weld overlay on the valve body and a laminated seat located on the leading edge of the disc, which is directly in the media's flow path. The ABZ body seat design puts the laminated seat in the bore of the valve with a solid replaceable seal on the disc. This reduces direct exposure from media flow to the laminated surfaces, this unique design also allows for field maintainable body seats and disc seals without special tooling.

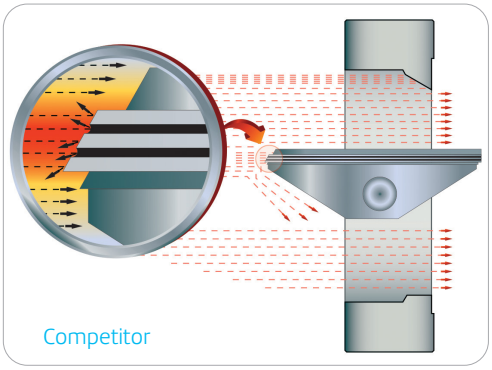
	Body Seat Design (ABZ)	Disc Seat Design (Competition)
Body Seat	Metal + Graphite-Laminate	Weld Overlay
Field Maintainable	Body Seat & Disc Seal	Disc Seat only



ABZ Valve

ABZ Valve Body Seat Design

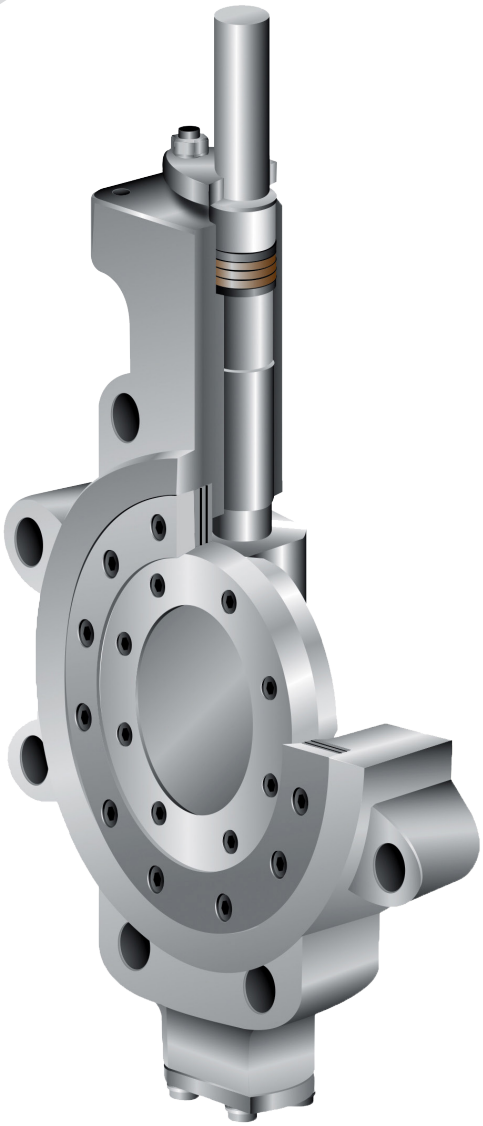
- Laminated body seat is moved away from the media's direct flow path thus reducing it's susceptibility to delamination and erosion.
- Solid disc seal (Replaceable)



Competitor

Competitor's Disc Seat Design

- Laminated body seat is positioned directly in media's flow path, which causes susceptibility to delamination and erosion.
- Solid seal is integral to the body. (Non-replaceable, weld overlay damage will require machining)

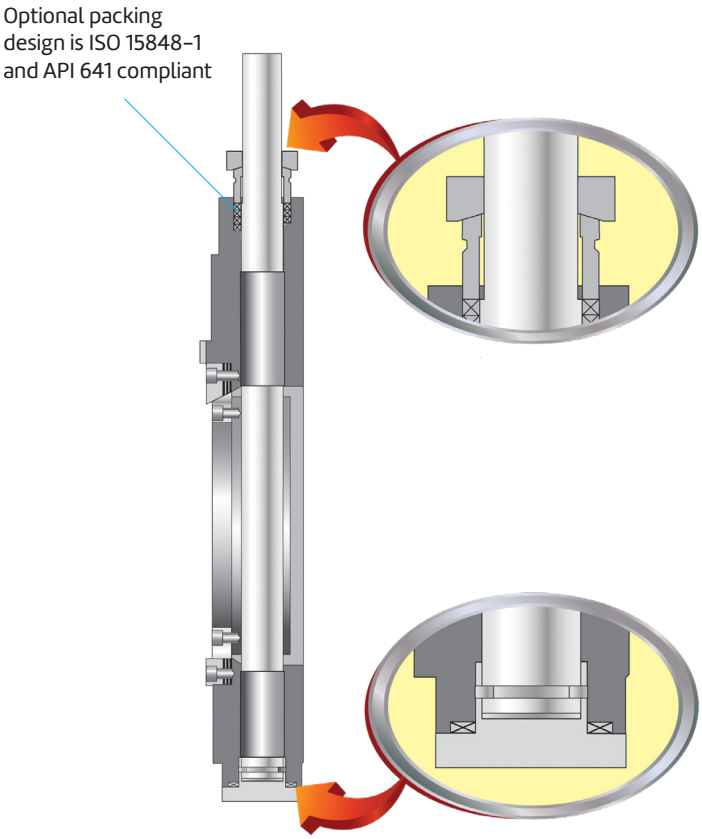


Sealing System

All sealing components (disc seal, body seat and retainer plate) are geometrically machined to an ellipse. Adjusting from a circular design helps reduces friction on the sealing surfaces and provides a tight shut off for long term service. This geometry also reduces the running torque, which provides a lower cost of ownership.

Fugitive Emissions

High temperature graphite packing provides constant compression for a positive seal around the shaft. The one-piece shaft enables the valve to withstand full bidirectional pressure as well as vacuum service. All Extreme 6000 Series valves are designed to API 609 standards. API 641 and ISO 15848-1 compliance is available with API 622 certified packing.



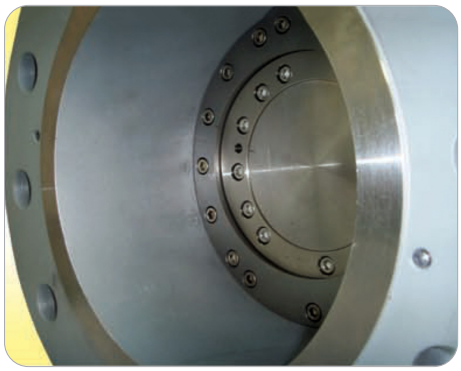
End Cap Arrangement

Design Comparisons

Alternative for Gate and Globe Valve

The Extreme 6000 Triple Offset has excellent sealing capabilities at high pressures and temperatures. These valves are popular with plant personnel when replacing gate valves for isolation. Triple Offsets also have throttling capabilities, which can be utilized when replacing globe valves.

Long Pattern Triple



Gate valve face-to-face

Tight Shut-off at full rating

The Extreme 6000 Series provides fully rated zero-leakage in both directions in air, gas and liquid applications. They are widely used for isolation when tight shut-off is required.

ABZ 6000

Design Standards

Design	API Std 609, ANSI/ASME B16.34
Classes	Class 150 - Class 900
Size	3" (80mm) - 56" (1400mm)
Body Style	Lugged, Wafer, Short and Long Pattern Flanged, Buttweld
Flange Drilling	ANSI/ASME B16.5, ANSI/ASME B16.47, ISO 7005, DIN2501
Face to Face Dimensions	ANSI/ASME B16.10, API 609, ISO 5752, BS5155
Applicable Temperature Range	~ + 800°F (427°C) for Standard *
Pressure Tests	API 598, ISO 5208 Rate A Bidirectionally
Operator	Manual, Electric, Pneumatic, Hydraulic
Fire-safe	API 607 7th Edition, ISO 10497 3rd Edition

* 1. Applicable temperatures varies with material.
2. 750°F (400°C) or less in an oxidized atmosphere.
3. Up to 1500°F (815°C) with special materials.
4. Down to -425°F (-253°C) with special construction and materials.

Available Materials

- Hastelloy
- Duplex 2205
- ALX6N
- SMO 254/255
- Monel
- Other materials available on request

Optional Upgrades (depicted by service conditions)

Body Seat Duplex Graphite-Laminate, Inconel Graphite-Laminate, Hastelloy Graphite-Laminate, Monel Graphite-Laminate
Disc Seal Hardfacing Stellite®
Bearings Stainless Steel 316 + HCr

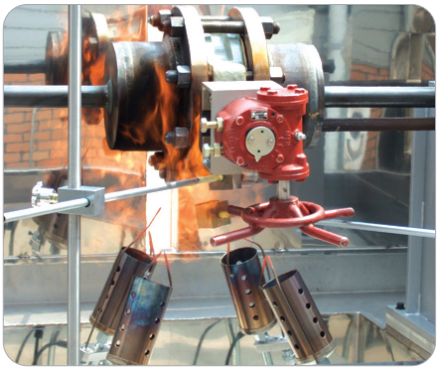
Cryogenic

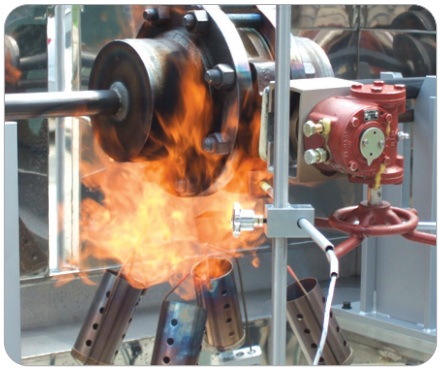
The Extreme 6000 also offers a cryogenic option for temperatures as low as -425°F (-235°C).

This valve design meets requirements for BS6364 and EN12567. All parts and materials are under strict quality management and go through cryogenic treatment before being machined. They are then placed in liquid nitrogen and cooled to -320°F (-196°C) where the shell and seat are tested with helium gas in both directions.

Fire Safe Design

The Extreme 6000 Valve is tested and certified to API 607 and ISO 10497; Valves hold to zero leakage before, during and after the fire.

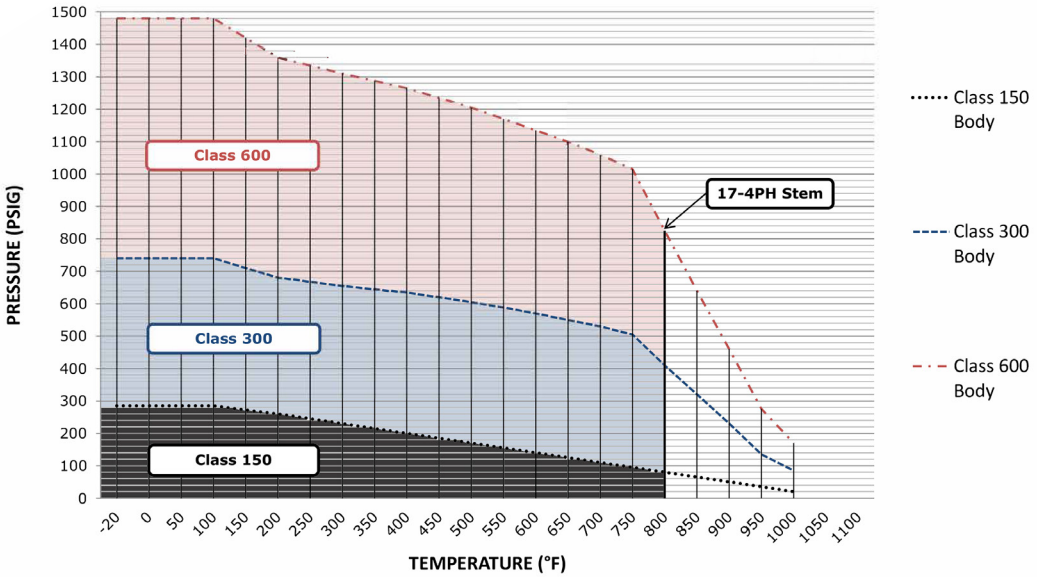




ABZ 6000-1000

Triple Offset High Performance

Pressure/Temperature Rating (A216 Gr. WCB)

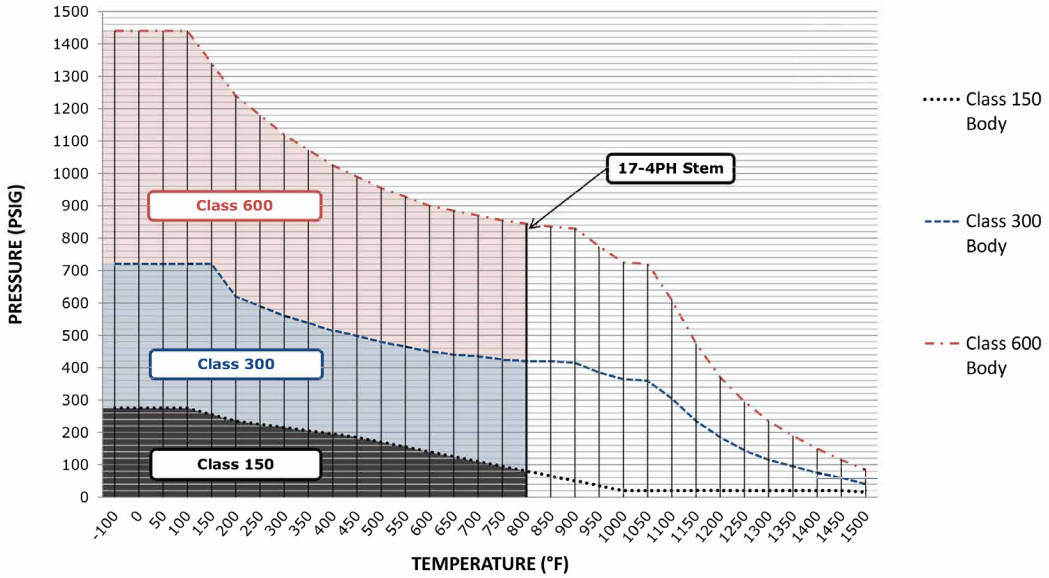


Maximum applicable Temperature for Stem & Seat:
STEM: 17-4PH: -100°F ~ 800°F
SEAT: 316SS/Graphite: -425°F ~ 1000°F

ABZ 6000-2000

Triple Offset High Performance

Pressure/Temperature Rating (A351 Gr. CF8M)



Maximum applicable Temperature for Stem & Seat:
STEM: 17-4PH: -100°F ~ 800°F
SEAT: 316SS/Graphite: -425°F ~ 1000°F

About ASC Engineered Solutions

ASC Engineered Solutions is defined by quality—in its products, services and support. With more than 1,400 employees, the company's portfolio of precision-engineered piping support, valves and connections provides products to more than 4,000 customers across industries, such as mechanical, industrial, fire protection, oil and gas, and commercial and residential construction. Its portfolio of leading brands includes ABZ Valve®, AFCON®, Anvil®, Anvil EPS, Anvil Services, Basic-PSA, Beck®, Catawissa, Cooplet®, FlexHead®, FPPI®, Gruvlok®, J.B. Smith, Merit®, North Alabama Pipe, Quadrant®, SCI®, Sharpe®, SlideLOK®, SPF® and SprinkFLEX®. With headquarters in Commerce, CA, and Exeter, NH, ASC also has ISO 9001:2015 certified production facilities in PA, TN, IL, TX, AL, LA, KS, and RI.
